*Failure, Mechanisms of
Selected Metals*

704. Tishness, N. V., On the question of the mechanism of fatigue failure of steel (in Russian), *Zh. tekhn. fiz.* 21, 2, 187-193, Feb. 1951.

Effects of fatigue on "Steel 20" with 31,000 psi endurance limit were made by counting the decreasing number of spots in x-ray patterns. As Barrett also reported ["Structure of metals," p. 79], spots become more diffuse with increasing numbers of cycles and with higher stresses, but no particular change occurs when the endurance limit is crossed. Orig Pub : Sbor Ceskosl. akad. zemed. ved, Rada-Rostl. vyroba, 1956, 29, No 3, 203-212
Abstract : A device is described, by means of which a thin layer of soil is cut off under laboratory conditions from a soil monolith (measuring 25 x 25 x 105 cm). In a special frame the soil specimen is treated at average humidity with colorless nitrocellulose lacquer. The latter solidifies the soil, preserving the natural color of the soil horizons. The

Title : Production of Semiconductor Elements, Status and Prospects -- General Conclusions.

Orig Pub : Tehnica, 1958, 13, No 10, 236-239

Abstract : Data are given with respect to the volume of manufacture of semiconductor devices (diodes and triodes) and the trends in their development on a global scale. The status of manufacture of these devices in Yugoslavia is considered, and it is noted that the requirements of the industry during the five year period from 1959 to 1963 exceeds the capacity for the manufacture of semiconductor devices, primarily because of lack of sufficiently numbers of specialists. This leads to the conclusion that it is necessary to speed up the training of corresponding

Title : Arrangement for the Measurement of the Specific Electric Resistivity, Hall Coefficient, and Type of Carriers in Semiconductors.

Orig Pub : Tehnika, 1958, 13, No 10, Electrotehnika, 7, No 10, 155-159

Abstract : Arrangement is described with eight probes for the measurement of the specific resistivity ρ , the Hall coefficient B and determining the type of current carriers in semiconductors. The instrument insures high accuracy of the inter-probe distance and ease in adjustment of the pressure of the probes against the sample.

The probes can be readily replaced as they are worn out. The value of ξ is measured with four probes at direct current. The arrangement makes it possible to measure ξ within 0.06 -- 0.0006 ohm-cm. The value of B is measured in a constant magnetic field with either four or two probes. The installation is reliable and can be used for the measurement of germanium and silicon specimens of various shapes. The results of the measurements with the aid of the arrangement described here agree with those obtained by others.

Title : The Beam Current Integrator Without Discharging Cycle

Orig Pub : Bull. Inst. Nud. Sci., 1958, 8, No 144, 117-122

Abstract : The authors describe a current integrator with measurement limits of 5×10^{-4} -- 3×10^{-12} amperes, intended for the measurement of intensity of a beam of charged particles. The measured current is applied to an electrometer amplifier (gain $\sim 5,000$), to the output of which is connected an integrating capacitor C. When the voltage in the capacitor reaches $+u_0$, a discriminator

operates, and the pulse from it is applied to the winding of the electromagnetic relay. The relay reverses the polarity of the capacitor C, so that the next cycle consists of recharging the capacitor from $-u_0$ to $+u_0$. The mechanical counter registers the number of pulses from the discriminator. The nonlinearity of the characteristics of the integrator is $\leq 1\%$. The maximum counting rate amounts to one count/sec. The instrument admits of a direct reading of the measured current along a scale of a pointer-type instrument. A total principal diagram and a photograph of the wiring of the integrator are shown.

Title : A Pulse Method for Measuring the Lifetime of Minority Carriers in Germanium

Orig Pub : Tehnika, 1958, 13, No 10, Elektrotehnika, 7, No 10, 161-164

Abstract : A definition is given of the lifetime of minority carriers τ , and the principal factors on which it depends are indicated. Five methods are briefly described for the measurement of τ in germanium. Preference is given to the optical method.

The weight of greens and the formation of sugar. K. TH. BOKS. Lesty Cukrovár. 51, 328; Z. Zuckersind. technoslovak. Rep 57, 219 (1943). In a comparison of averages for several years, the formation of sugar is greater in the years with an abundant growth of greens than in the years of scanty greens. The exptl data, however, have never shown a real correlation between the wt of greens and sugar formation. When different varieties of the same season are compared, no correlation is found. Weekly analyses made upon 16 varieties of beets in Sweden from July to Nov. show the absence of this correlation. From July 25 to Nov. 11 the av. wt of greens from one variety was 230 g while the sugar formation during the same interval was 90 g. Other varieties showed 276 g greens with 101 g sugar, 313 g greens with 84 g sugar, and 315 g greens with 70 g sugar.

Weight of leaves and formation of sugar (in beets). K. TUNNYS (Z. Zuckerind. Czechoslov., 1933, 57, 216).—Experiments with 16 races of sugar beet over a no. of years, at the Swedish Sugar Beet Institute, Hillesbög, showed that in comparing the same race in different years there is a general parallelism between wt. of leaves and amount of sugar formed; but in comparing different races in the same year there is no relation between leaf growth and sugar formation. The effects of weather conditions on leaf growth are much the same for different races, but their effects on sugar formation are not so uniform. J. H. L.

Harvesting 2-year-old roots of kok-saghis after preliminary removal of foliage. P. TUDKAVKIN (Soviet. Sel'sk. Hoz., 1944, No. 8 0, 81-2; Hort. Abz. 1946, 16, 100). Experiments made by the Siberian Central Crops Research Institute in 1943 showed that a preliminary removal of the rosette just to the digging up of roots increased their rubber content. The figures obtained on a two-year-old plantation were as follows. If the rosette was removed 4 hours before harvesting the roots, their rubber content rose only from 11.5 to 11.9%. When, however, the removal was made 21 and 120 hours before digging, the increase in the rubber content was from 9.2 to 11.2% and from 9.2 to 11.7%, respectively. This method could be used with success on 2-year-old plantations on compact soil, and requires 4 man-days per hectare. 1228.5

"Protein Metabolism. I. "

Prague, Casopis Lekarů Ceskych, Vol 105, No 33, 19 Aug 66, pp 886 - 889

Abstract [Authors' English summary modified]: During the first days of protein deficiency a systematic drop in albumins and a concurrent rise of globulin fractions occur. Quantitative changes are noticed mainly in the alpha and beta globulins, which are found in the first 20 days of protein deficiency; a new fraction corresponding to the alpha globulin appears. Gamma globulin fraction changes very little. Total nitrogen decreases to about 75% of the initial value. 3 Figures, 2 Tables, 10 Western, 4 Czech, 1 Russian, 1 Hungarian reference. Herbacea

Orig Pub : Sb. tr. Tbilissk n-i khim-farmatsevt. i-ta, 1956, kn.,
8, 91-100

Abstract : The pharmacological properties of the sulfate salt of the alkaloid of Vinca Herbacea (I) were investigated in frogs, rabbits, and dogs and compared to atropine. In lumbar (2) frogs subcutaneous injection or injection in the large cutaneous vein, I, in certain concentrations, fully removed the action of the vagus nerve upon the heart. Despite this, I slowed the heart rhythm, dilated the pupils, decreased secretion of saliva, caused by atropine. It follows that the specific properties of I are similar to those of atropine, but to a lesser degree. A hypotensive effect of I was also demonstrated. V.V. Berezhinskaya.

Title: Study of Aging of Natural Latex with the Aid of Infrared Spectroscopy.
VI. Aging Under the Influence of Heat and Light; Discussion

Original Periodical: Chem. listy, 1955, 49, No 11, 1587-1597; Slovak

Abstract: The infrared-spectroscopy method was used to investigate the heat and light aging of latex, and the mechanism of aging is examined and certain relationships are established between oxidation, changes in structure, and the mechanical properties. The dependence of the velocity of oxidation on the concentration of the oxidation products during thermal and light aging indicates a chain mechanism of the reaction occurring in the rubber. The physical properties of aged latex depend, first of all, on the degree of destruction and a structurization not simply on the quantity of bound oxygen.

3147. Infrared studies of the ageing of rubber.
 VI. Ageing under the influence of heat and light.
 Discussion. A. TXAÛ, and Y. KELLÛ. *Chem. Listy*,
 1955, 49, 1537-37; *Chem. Abs.*, 1956, 50, 1350. Cf.
 this journal, 1956, abs. 2910. Both the heat and
 light-ageing (oxidation) rates depend on the con-
 centration of oxidised groups according to a relation
 which indicates a mechanism of branching chains
 with negative chain interaction. Light ageing has
 a superficial character and shows a more intensive
 initiation. The heights of kinetic curves represent
 a measure of the number of side chains formed
 during both ageing and vulcanisation. The physical
 properties depend predominantly on the degree of
 disaggregation and reaggregation, but not directly
 on the amount of structurally bound oxygen.

~~Reaction kinetics in the aging of natural rubber by infra-red spectroscopy. V. Aging accelerated by heat. Vojtech Kocil, Alexander Tkáč, and Jolana Hriviková (Slovenská vyzk. úst. techn. Bratislava, Czech.). Chem. Listy 49, 1433-41 (1955); cf. C.I. 49, 6639h. Heat aging of rubber between 60 and 160° as measured by the change of the no. of C=O, O-H, and C=C groups has been investigated by infrared spectroscopy. Contrary to light aging, heat aging proceeds uniformly in the whole specimen thickness at temps. above 90° but has a superficial character below this temp. The time curves of C=O and O-H groups run parallel, the only difference being that the no. of O-H groups decreases after reaching the max. The heights of the S-shaped kinetic curves depend on temp., show a min. in the range between 75 and 95°, and above a certain temp. limit remain const. (C=O above 120°, O-H above 100°). Activation energies calcd. from the induction periods are 21,200 and 21,300 cal./mole, resp., for C=O and O-H groups; these values agree well with the activation energy calcd. from the temp. dependence of the max. rate of oxidation, 21,000 cal./mole. Study of the reaction kinetics in the aging of natural rubber by infrared spectrography. II. Effect of light. A. Tkáč and V. Kella (Slovenská vysoká škola technická, Bratislava, Czech.). *Chem. Zvesti* 7, 57-58 (1953).—Qual. changes in the infrared spectrum of raw rubber by exposing specimens 0.02-0.03 mm. thick to the light of a Hg-quartz lamp, are described. After a longer period of exposure to light, there is a new band at 5.60 μ , indicating aldehydic, ketonic (a band with the center 5.80-5.82 μ), and carboxyl groups. OH groups, present in untreated raw rubber at 2.98-2.96 μ , are increased by exposure to light, showing a new intensive band at 2.80 μ . With masticated rubber, a band is formed at 2.90 μ in the area of OH groups associated with H bridges, but the band belongs to unassociated OH groups. By exposure to light, the C=O, O-H, and C-O groups are increased, the CH₂, CH, and isoprene groups are decreased, and C=C and a band at 10 μ are changed. Other factors affecting the aging of raw rubber by light are described. 61 references.

Tisk (Slovenská vysoká škola techn., Bratislava, Czech.). *Chem. Zvesti* 7, 395-408 (1969); cf. C.A. 48, 6153d. Reaction charts showing the relation of C=O groups to the time of exposure to infrared light were studied. H_2O_2 , phenyl-2-naphthylamine, *o*-nitrophenol, *m*-nitrophenol, *p*-nitrophenol, 1,2,4-dinitrophenol, *o*-aminophenol, benzoquinone, quinhydrone, hydroquinone, pyrogallol, Ni diethyldithiocarbamate, benzidine, urea, thiourea, and thyroxine were divided into inhibitors, retarders, and initiators of oxidation. A study of *p*-benzoquinone, quinhydrone, hydroquinone, and pyrogallol shows that the antioxidant effect is in close relation with the oxidation-reduction potential system: rubber-O-antioxidant. The natural antioxidants and natural oxidation-reduction system in raw rubber form a natural oxidation-reduction system which det. the qualities of natural raw rubber. The results of spectrographic measurements show that antioxidants participate directly on the reaction mechanism, and that the most important factor is the rapidity of formation of free radicals and their reaction with other radicals and neutral mol. Reaction kinetics in the aging of natural rubber by the infrared spectrograph. IV. Effect of the wavelength of radiation and the temperature on aging by light. A. Tkáč, V. Kello, and J. Hrivková (Slovenská vysoká škola technická v Bratislave, Ústav kábelov a izolantov, Bratislava, Czech.). *Chem. Zvesti* 8, 3-13(1954); cf. *C.A.* 48, 8674e, 8153b, 11101d.— The interrelation of the effect of the intensity of radiation and temp. on the aging of rubber was studied. The upper limit of the effectiveness of light is in an area 4380 Å. Increasing temp. accelerates oxidation considerably, but it is retarded by increasing intensity of irradiation. Calculations show an exponential relation of the length of the induction period and the intensity of radiation at const. temp. and a linear relation of the height of the reaction curves and temp. with const. radiation. In the aging of natural rubber, there is, at the same time, an oxidative cleavage and branch chaining (vulcanization). Heat accelerates oxidation, and radiation accelerates vulcanization.

The reasons for rapid hardening of thiokol. A. Tkáč, V. Kellö, and L. Ulický (Slovenská vysoká škola technická, Bratislava, Czech.). Chem. zprávy 12, 391-400 (1953) (German summary).—By studying the factors causing a rapid hardening of thiokol (I) of domestic origin (Czech.), it was detd. that the loss of plasticity and elasticity is caused by polymer crystn. The decompn. products of Na₂S₂ formed by thermal reaction or by spontaneous oxidation of S linked to Na₂S₂ accelerate the process of crystn. By prep. I from Na₂S₂ soln. of definitive concn., a product resistant to rapid hardening is formed which by infrared absorption spectral analyses has shown to be different in the amt. of bound H₂O, decompn. products, and oxidation impurities from a rapid hardening tech. pure product. The structural analyses indicate the presence of cyclic bound S which is in agreement with the results of x-ray structural analyses.

 Correlations between the degree of cross-linking and the degradation of natural rubber. A. Tkáč and V. Kello (Tech. Hochschule, Bratislava, Czech). *J. Polymer Sci.* 31, 291-300 (1958) (in German); cf. C.A. 50, 1350j, 17507i.
 — The rate of oxidn. of natural rubber is measured by observing the increase ΔA of the extinction coeff. for infrared absorption at 1720 cm^{-1} (carbonyl) and 3600 cm^{-1} (hydroxyl). The relative concn. η of oxidized groups is taken as $\Delta A / \Delta A_{\infty}$, where ΔA_{∞} is the value of the increase of the extinction coeff. at infinite time. The rate of oxidn. $d\eta/dt$ is found to obey an equation of the form $d\eta/dt = (k/b)[1 - \exp(-b\eta)](1 - \eta)$, where the const. k is related to the rate of branching (leading preponderantly to oxidn.) and the const. b characterizes the rate of recombination of radicals for chain termination (leading preponderantly to cross-linking). The total amt. of cross-linking increases with increase of b/k . In all cases, as predicted by the equation,

the rate of oxidn. rises from zero to a max. and falls to zero again as the concn. of oxidized groups increases. Values of k and b detd. from exptl. observations are used to give information about the sep. phases of the reactions involved in the thermal and photochem. aging of rubber under various conditions. In the aging of extd. unvulcanized rubber at temps. from 80 to 150°, the rate of oxidn. and of termination both increase with temp. but the degree of cross-linking decreases. Light produces very effective cross-linking at room temp.; raising the temp. increases the oxidn. greatly at the expense of the termination, but vulcanization mixts. contg. components forming C—C bridges are much more effective. The effects of accelerators, of antioxidants, and of Cu as an oxidn. catalyst are investigated. In rubber, in the presence of pure N (3 atm., 130°) and in the absence of vulcanizing ingredients, radicals of long life are formed and greatly influence the subsequent oxidative degradation. Increase of time at 130° greatly decreases the induction period of the subsequent oxidn. and increases the max. possible degree of oxidn.
 Lawrence A. Wood

Physicochemical study of petroleum crude oil fractions. V. Reaction kinetics of oxidation. A. Tkáč and V. Kello (Stavenská vysoká škola tech., Bratislava, Czech.). *Chem. zvesti* 13, 402-514 (1959) (German summary); cf. *C.A.* 54, 2706c. —The reaction kinetics were studied of the oxidn. of the mixt. of hydrocarbons present in domestic crude oils and their lubricating oil distillates, chromatographic fractions of cable oils, and aromatic exts. from Saratov crude oil. Quant. spectrographic analysis of the changes in the hydrocarbon structure (which had been detd. by the n-d-mol. wt. method) shows a different character of the reaction kinetics for different compns. of the hydrocarbon mixt. The oxidn. of the alkane-naphthene fractions is affected by the rate of diffusion of O and of the oxidn. products, but this does not occur in the presence of aromatic components. The effect of diffusion was considerably reduced by exposing samples in thin layers. The oxidn. of the alkane-naphthene fractions can be expressed by the equation $\Delta E_t = a - k \cdot e^{-\phi t}$, where ΔE is the change in the extinction; and ϕ and k are const., corresponding to the chain mechanism of oxidn. of the degenerated branching type. With increasing content of aromatic fractions the oxidn. proceeds at a const. rate without induction period; and oxidn. of the alkane-naphthene fractions is inhibited. Fractions contg. a major amt. of condensed and unsym. di- and trisubstituted aromatic hydrocarbons are as much as 20 times more effective as in-

hibitors than complex aromatic-naphthenic systems and more highly substituted monocyclic aromatic compds. Highly active inhibitors are present in aromatic exts. of Saratov crude oil. The activation energy of the oxidn. of pure alkane-naphthene fractions is 33 kcal./mol., and in the presence of the aromatic components (5% of aromatic C) decreases to 9 kcal./mol. Polar oxidn. products of aromatic hydrocarbons are insol. in the alkane-naphthene hydrocarbons and are pptd. whereas oxidn. of the alkane-naphthene type hydrocarbons leads to the formation of carboxyl groups. VI. The correlation of composition, stability, and dielectric properties of hydrocarbons from domestic crude oils. A. Tkáč, V. Kello, and V. Palo. *Ibid.* 516-23. —The oxidn. products of alkane-naphthene and aromatic chromatographic fractions vary in their effect on the dielec. properties of insulating oils. Trace amts. of oxidn. products of aromatic compds. of definite structure considerably increase the loss angle, but even higher concns. of alkanes derivs. affected the loss angle to a lesser degree. Mixts. contg. complex aromatic-naphthenic compds. and more highly substituted aromatic hydrocarbons with long aliphatic chains showed optimum oxidn. stability and elec. properties.

AUTHORS: Tkač, A., Frait, Z., Ondris, M.

TITLE: Determination of the level of macroradicals by the method of electron spin resonance during thermal decomposition of polymers.

PERIODICAL: Chemické zvesti, ¹⁷⁻no. 2, 1963, 81-94.

TEXT: The method of electron spin resonance was used in the study of the formation and decomposition of macroradicals of the polydiene type, (in natural rubber and polyisoprene) in solid samples within the temperature limits of - 150°C and + 200°C. Suitable apparatus for the desorption of gases from samples is described. High vacuum and an inert gas are used for the purpose. A description of the arrangement used by the authors for their measurements is given. It provides electrical heating and quick cooling of the samples by liquid nitrogen. The thermal generation of the free radicals takes place in a resonance chamber of the mode H_{012} maintained at a constant temperature. An inert gas flows through the chamber introduced through a stainless steel duct provided with a mica orifice. The apparatus allows cooling of the sample from the temperature at which the radicals are formed to the temperature of liquid nitrogen while continuous indication of the intensity of the changes in

Card 1 of 3

Determination of the level

the resonance signals is maintained. Quick cooling avoids changes in the composition of the sample that would occur during slow cooling. The resonance signal which is formed by the absorption of the microwave component of 9200 Mc₂ in a magnetic field of 2900 Oe maintains a "g" factor of 2.2 and is the result of the inner mechanism of the processes that take place during the degradation of polydienes at elevated temperatures. With an increase in temperature the original width of the spectrum narrows from approx. ΔH 300-200 Oe to 100-80 Oe; this fact is connected with the weakening of the interaction forces. The use of a stable free radical α , α' diphenyl- β -picrylhydrazyl for calibration purposes made possible determination of the shift of the center of symmetry by approx. 100-150 Oe towards the region of the free electron when the sample was heated to 200°C. This results in a change of the "g" factor from 2.23 to 2.14. This process is reversible. The signal does not change its position during cooling from room temperature to -150°C. The technique of quick cooling makes possible, when using samples contaminated by oxygen, to observe a distinct peroxydic doublet in the region of the free electron, even in a case where the level of these radicals at higher temperatures is in the area of the limits of the sensitivity of the apparatus (10^{12} free spins in 0.1 grams of sample).

Stakhanovite Methods in the Operation of a Blast-Furnace Works. P. Gorlov, A. Tkach and F. Khl'kevich. (Stal, 1939, No. 1, pp. 1-9). (In Russian). A number of improvements in equipment and operational control effected at the Krivorog blast-furnace plant are described. Attention has been paid to the steady working of the furnace by adopting a planned rate of charging and uncharging sequence and a corresponding blast control. A more uniform moistening of the ore was achieved by spraying it with water in the truck discharging hoppers instead of in the skips. Other improvements included a modification of the coko screening plant and the provision of a recording instrument to register the working of the McKee distributor. A machine has been constructed for piercing the iron notch. In conclusion, the removal of scaffolding from blast-furnace shafts by blasting is described.

TITLE: X-ray Diffraction Studies of Stresses of the First Kind in Nitrided Steel (Rentgenograficheskoye issledovaniye napryazheniy I roda v azotirovannoy stali)

PERIODICAL: Tr. Kharkovsk. politekhn. in-ta, 1958, Nr 14, pp 195-202

ABSTRACT: Specimens of steels 38, KhMYuA, and 20 were investigated. After nitriding, the residual stresses were determined by the method of oblique exposures; this involved X-ray diffraction patterns obtained in the back-reflection camera for three different positions of the surface of the specimens, one perpendicular to the primary bundle of rays and the other two at angles of 45° with respect to the beam. The lattice parameters of the α and γ phase were measured under $Cr-K_\alpha$ radiation. The employment of large reflection angles ($78-80^\circ$), photometric evaluation of the lines, etc., made it possible to determine stresses with an accuracy of $7-10 \text{ kg/mm}^2$. Results of an investigation are presented which demonstrate that compressive residual stresses having a magnitude of up to $40-50 \text{ kg/mm}^2$ are

Card 1/2
